

**Cut This Out Now and Save It**

This advertisement, with signatures cut from Arbuckles' Coffee packages, will count the same as five signatures!

To appreciate how valuable it is, notice that you get the six fine teaspoons shown above for only 28 Arbuckle signatures by saving this advertisement, instead of 33, which you would otherwise have to collect.

This beautiful silverware is made exclusively for us by the celebrated manufacturer, Wm. A. Rogers. It is real German silver and is solid metal throughout. It will last a lifetime as there is no plating to wear off. The pretty violet pattern is effective and very new.

Get a package of Arbuckles' rich, full-flavored coffee from your grocer today—save the signature with this advertisement. You will then have six—a fine start toward getting these teaspoons.

You know how badly every family needs teaspoons. Start now collecting signatures.

## FARMERS TOLD HOW TO CONTROL BEAN DISEASES

Blight and Anthracnose Cause Losses and Department Tells How to Avoid Them.

WASHINGTON, D. C., June 5.—The blight and anthracnose of garden and field beans caused a loss in Michigan alone estimated at \$2,000,000 or twenty per cent of the crop of 1913. This state does not stand alone for similar conditions obtain in other bean-growing sections. It is becoming more difficult each year to secure bean seed from from one or both of these diseases. In view of the fact, it is highly important that the diseases be more thoroughly recognized and that the best available methods of control, some of which must be begun in the early cultivation of the plants, be understood and put into practice.

### Cause of Anthracnose.

Bean anthracnose is caused by a fungus which attacks the stems, leaves, pods and seeds of the plants. On the stems and leaf veins it causes elongated, sunken, dark-red cankers, sometimes killing young plants and often producing deformed and yellowed leaves. Round or irregular sunken spots with a slightly raised rim are produced on the pods. The spots usually have pink centers surrounded by a darker reddish border. In severe cases the pods may be entirely covered by the sores and produce no seed. In other cases the fungus penetrates the pods and enters the seed, causing dark, sunken specks or spots. In these diseased seed as well as in the refuse from diseased plants the fungus is propagated from season to season.

### Cause of Blight.

The bean blight differs from anthracnose in several ways. It is caused by a bacterial organism. On the leaves it produces irregular, diseased areas which at first have a watersoaked appearance, later dry out and become brown and brittle. The entire margin or half of a leaflet is often affected. On the pods the disease starts as slightly raised and watery pustules, which later enlarge, become of irregular shape and amber color with yellow centers. Infected seed show yellow diseased blotches or are entirely yellowed and shriveled.

### Nature of Loss.

Both diseases cause serious losses in the snap bean trade. Diseased pods are unmarketable and must be sorted out. If but a few slightly spotted pods are picked in a basket, the disease may spread during shipment, causing additional loss and necessitating extra sorting before the beans can be sold to the customer. In the seed bean trade all beans must be hand-picked to get out the discolored diseased seeds. From fifteen to thirty per cent of diseased beans are frequently sorted out, involving heavy loss of beans as well as the cost of sorting. Diseased beans used for seed usually give a poor stand and result in the production of a badly diseased crop.

### Control Measures.

It has been conclusively demonstrated that anthracnose can be avoided by a careful system of seed selection. Save seed from perfectly healthy pods, selected with great care for entire absence of spotting. Carefully keep them away from diseased pods, shell by hand to avoid reinfection, and plant on clean land. Pull and burn any plants showing disease. By planting the seed thus secured enough disease-free seed can be secured to plant the whole crop.

In the absence of such disease-free seed (1) secure for planting, seed having the least possible amount of disease, as shown by actual examination; (2) all seed should be hand-picked and no seed showing the slightest discoloration should be planted; (3) practice crop rotation, never plant beans on land where the same crop grew the previous season; (4) do not cultivate or walk through the bean field or pick beans while wet with dew or rain. If the disease is present it is then easily spread from one part of the field to another.

The bean blight is more difficult to control than anthracnose, but the same methods will give the best results at present available.

## FOURTH CLASS

Postmasters Are Appointed for a Number of Places in West Virginia.

(SPECIAL TO THE TELEGRAM)  
WASHINGTON, D. C., June 5.—Fourth class postmasters have been appointed as follows in West Virginia: At Clifton, Braxton county; William F. Stewart in place of Shelton R. Rose; at Five Mile, Mason county; Alonzo C. Kelly, in place of Isaac Fadelay, deceased; at Landes, Grant county; Bert F. Hiser in place of Adam B. Shreve; at Lawn, Greenbrier county; Della A.
